A specification often refers to a set of documented requirements to be satisfied by a material, design, product, or service. A specification is often a type of technical standard.. There are different types of technical or engineering specifications (specs), and the term is used differently in different technical contexts.

There are well-founded concerns that current air transportation systems will not be able to cope with their expected growth. Current processes, procedures and technologies in aeronautical communications do not provide the flexibility needed to meet the growing demands. Aeronautical communications is seen as a major bottleneck stressing capacity limits in air transportation. Ongoing research projects are developing the fundamental methods, concepts and technologies for future aeronautical communications that are required to enable higher capacities in air transportation. The aim of this book is to edit the

ensemble of newest contributions and research results in the field of future aeronautical communications. The book gives the readers the opportunity to deepen and broaden their knowledge of this field. Today's and tomorrow's problems / methods in the field of aeronautical communications are treated: current trends are identified; IPv6 aeronautical network aspect are covered; challenges for the satellite component are illustrated; AeroMACS and LDACS as future data links are investigated and visions for aeronautical communications are formulated.

Silicon technology now allows us to build chips consisting of tens of millions of transistors. This technology promises new levels of system integration onto a single chip, but also presents significant challenges to the chip designer. As a result, many ASIC developers and silicon vendors are re-examining their design methodologies, searching for ways to make effective use of the huge numbers of gates now available. These designers see current design tools and methodologies as inadequate for developing million-gate ASICs from scratch. There is considerable pressure to keep design team size and design schedules constant while design complexities grow. Tools are not providing the productivity gains required to keep pace with the increasing gate counts available from deep submicron technology. Design reuse - the use of pre-designed and pre-verified cores - is the most promising opportunity to bridge the gap between available gate-count and designer productivity. Reuse Methodology Manual for System-On-A-Chip Designs outlines an effective methodology for creating reusable designs for use in a System-on-a-Chip (SoC) design methodology. Silicon and tool technologies move so quickly that no single methodology can provide a permanent solution to this highly dynamic problem. Instead, this manual is

an attempt to capture and incrementally improve on current best practices in the industry, and to give a coherent, integrated view of the design process. From the Foreword `Synopsys and Mentor Graphics have joined forces to help make IP reuse a reality. One of the goals of our Design Reuse Partnership is to develop, demonstrate, and document a reuse-based design methodology that works. The Reuse Manual (RMM) is the result of this effort.' Taking as its point of departure the fundamental observation that games are both technical and symbolic, this collection investigates the multiple intersections between the study of computer games and the discipline of technical and professional writing. Divided into five parts, *Computer Games and Technical Communication* engages with questions related to workplace communities and gamic simulations; industry documentation; manuals, gameplay, and ethics; training, testing, and number crunching; and the work of games and gamifying work. In that computer games rely on a complex combination of written, verbal, visual, algorithmic, audio, and kinesthetic means to convey information, technical and professional writing scholars are uniquely poised to investigate the intersection between the technical and symbolic aspects of the computer game complex. The contributors to this volume bring to bear the analytic tools of the field to interpret the roles of communication, production, and consumption in this increasingly ubiquitous technical and symbolic medium.

Far too many companies have developed outsourcing agreements that were created for a bygone century. Or worse, they are buying strategic services using an overly simplified commodity approach. Today's companies must build deep collaborative relationships with their suppliers that can accelerate the pace of innovation and competitive advantage amidst a new era of continual change and transformational shifts. This requires adopting a new methodology that has the inherent framework to design new levels of collaboration to drive business value. This new methodology is Vested Outsourcing. The Vested Outsourcing Manual is the companion guide to the ground-breaking book, *Vested Outsourcing: Five Rules That Will Transform Outsourcing*. The break-out book introduced the research study conducted by The University of Tennessee and challenged the conventional approach to how companies outsource. In *The Vested Outsourcing Manual*, Kate Vitasek and her co-authors have taken the Five Rules of Vested Outsourcing and developed the roadmap to creating a Vested Agreement through which each party has a vested interest in mutually-defined and desired outcomes. Vested Outsourcing methodology is built on a flexible framework that lays the foundational structure for the parties to come together and create a shared vision, foster an anticipatory lens, share evolving expertise, manage change and drive the required behavior for both parties to drive innovation and mitigate risk. These flexible - vested - agreements will allow the creation of value systems that have the ability to transform every industry and

society. Shared vision, desired outcomes, transparency, trust, and win-win are not simply buzz words - they are the principals and values of Vested Outsourcing, being embraced by innovative giants like Microsoft, Intel, and P&G. Now companies and their suppliers have the manual to create a business model for a new century of constant change.
